407 ETR Scales Mobile App with Kinvey to Handle up to 2 Million Customers

407 ETR, the world's first barrier free all electronic toll highway, set out to build a customer service mobile app like no other that would, according to 407 ETR Group Architect Ravi Chander, "leverage existing technologies and embrace new technologies to meet the expectations of the future in-car digital experience as driving continues to get more sophisticated."

CHALLENGE

Build a customer service mobile app that matches the technology marvel that defines 407 ETR.

SOLUTION

Kinvey offers a scalable, highly-available platform that provided critical features out of the box

407 ETR developers could focus on customer-facing frontend features without worrying about infrastructure

Kinvey's end-to-end security enables 407 ETR readily to authorize and authenticate users

RESULTS

Potentially months of development work whittled down to two lines of code to authenticate users

Kinvey's scalability handles all of 407 ETR's APIs and data collections, crucial to real-time interactions

The ability to choose from multiple industry-standard security options ensures end user privacy and protection

"We've got an enormous amount of data at every layer that must scale. The Kinvey architecture was the solution to handle all our APIs and data collections—crucial to the app's success."
